ArcGIS Premium Imagery Services: Satellite Tasking & Archive
Available through Esri’s ArcGIS Marketplace
ArcGIS Marketplace: Satellite Tasking & Archive App

There has never been an easier or faster way for ArcGIS users to receive newly acquired satellite imagery than through the Satellite Tasking & Archive app from Airbus Defence and Space, available through Esri’s ArcGIS Marketplace.

Tasking Options

New imagery is needed for multiple applications, but the urgency of this need varies depending on the application. For this reason, two tasking options have been developed: Automatic Tasking and Instant Tasking.

Automatic Tasking: allows users to submit a satellite tasking request over an Area of Interest, and receive the data within 30 or 60 days. This is a great solution for anyone who needs fresh imagery.

Instant Tasking: the user is guaranteed to receive an image over the Area of Interest on an exact date. Users can choose to acquire an image on the next satellite pass or on a specific day in the future. This maximum priority satellite tasking service is the absolute fastest way to receive a newly acquired image. The image is delivered with no commitment on cloud cover, so it is important for the user to take weather and other atmospheric conditions into consideration when using this service.

Extensive Archive

The Airbus DS extensive, multi-resolution archive covers most of the Earth’s landmass. Through this app, users can easily search through the archive to find the imagery that they need.

All tasking and archive options for an area of interest are shown on the same screen, allowing for a quick assessment of the imagery options available.

How to Get Started

Visit marketplace.arcgis.com and search Airbus Defence and Space in the search bar at the top of the page. ArcGIS users can find the Satellite Tasking & Archive app and start searching for imagery options, or they can select one of the other Airbus DS Premium Imagery Services on the Marketplace home page.
